

Find, Fix & Monitor Web Accessibility — Automatically

Paste a URL. AccessDrift launches a real headless Chrome, runs axe-core against the live page(s) across the full WCAG 2.0/2.1/2.2 A & AA ruleset, and diffs the result against the last saved scan of that domain — so you find out about the exact release that made things worse, not just today's score. [Live: accessdrift-z1eh.onrender.com](https://accessdrift-z1eh.onrender.com)

01

Scan

Paste any URL (or pick a preset: example.com, this app). Crawl depth 1–20 pages.

02

Read the diff

New / persisting / resolved violations, plus a severity-weighted score and the delta since last scan.

03

Apply the fix

Rule-based fix suggestions by default; set ANTHROPIC_API_KEY to get Claude-written fixes for critical/serious findings.

Core Features

FEATURE	DETAIL
Live WCAG audit	System Chrome + axe-core, full A/AA ruleset
Multi-page crawl	Follows same-origin links, 1–20 pages
Diff / score engine	New vs. persisting vs. resolved, severity-weighted
Time-series tracking	Each scan diffs against the domain's last saved scan
Element screenshots	Top violations captured with a highlight box
Confidence warnings	Flags likely consent/bot walls — never silently wrong
Auto-fix mode	Deterministically repairs alt text, labels, lang, names
Scheduled monitoring	Re-scans watched sites, alerts only on regression

HTTP API

METHOD	PATH	PURPOSE
POST	/scan	Scan a URL, diff vs. history, persist
POST	/fix	Auto-repair a pasted HTML string
GET	/api/scans	List saved scans
GET	/api/trends	Cross-domain trends dashboard
GET/POST	/api/watches	List / add a monitored site
GET	/preset/:name	Load demo data (no live scan needed)

The Drift Signal Framework

- **New** — introduced this release, act now
- **Persisting** — known, still open
- **Resolved** — fixed and verified gone
- **Watch** — model isn't confident; human-verify

Known Limitations (Honest)

- **No persistent disk on the live deployment** — the free Render plan has no attached disk, so scan history resets on redeploy. Fine for demoing one scan; not durable for long-term monitoring without a paid plan.
- **One DOM snapshot per page** — axe audits the rendered DOM; it can't catch keyboard-trap or screen-reader-only issues that need interaction.
- **Consent / bot walls** — some sites (e.g. heavily CDN-protected domains) return an HTTP error to headless Chrome; the tool warns rather than silently misreporting.
- **Score is a heuristic**, not an official conformance grade — useful for tracking trends release over release.
- **AI fixes are optional** — without ANTHROPIC_API_KEY set, every fix still works via the rule-based knowledge base; it just isn't Claude-written.
