

WCAG ACCESSIBILITY · MADISON FRAMEWORK

Accessibility Monitor

The smoke detector for your website's accessibility.

It sleeps silently in the background and only goes off the moment a release breaks your site — before a disabled user, or a lawsuit, finds it first.

• Kanishk Singh · INFO 7375 · Northeastern University

- WHAT SUCKS IN THE WORLD

Small teams pass an accessibility audit once — then silently break it on the next deploy.

Web accessibility — whether people with disabilities can actually use your site — isn't a one-time checkbox. It rots, release by release, and nobody notices until someone's harmed.

~96%

of the top 1M home pages fail the official accessibility standard — WCAG (WebAIM Million)

4,000+

U.S. ADA web-accessibility lawsuits filed per year
— increasingly against small businesses

1 in 4

U.S. adults lives with a disability — every regression locks real users out (CDC)

— A 2–20-person team updates its site weekly, has no accessibility expert, and only checks by hand when someone remembers. Nothing remembers last week's state — so when something breaks, it slips out unnoticed.

- THE AHA MOMENT

It's not another scanner. It's a smoke detector for accessibility.

A smoke detector doesn't inspect your house — it sleeps until something starts to burn, then screams. Accessibility Monitor does the same: it watches every release and answers one question — **"Did this deploy make accessibility better or worse than last time?"**

- **Runs on every update** — automatically on each release and weekly, so no one has to remember.
- **Compares to last time** — flags exactly what's **new**, what carried over, and what you **fixed**.
- **Plain-English report** — tells a non-specialist developer who is hurt, why, and the exact fix.
- **Only alerts when things get worse** — no noise. You hear from it when, and only when, the site got worse.

- THE SECRET SAUCE, IN HUMAN TERMS

We use AI to turn an error code no one understands into the exact fix — in plain English.

SEE**Look at the live page**

We open your site like a real visitor and find what's actually broken.

**EXPLAIN****AI writes the fix**

It reads the broken part, checks the official rule, and explains the repair.

**VERIFY****Never guesses**

If the AI isn't sure, it falls back to a human-verified rulebook.

Why this wasn't possible before: old tools just printed a code like

• • •

`image-alt` and left you to Google it. Today an AI can **look at your page, point to the exact problem, and hand you the answer.**

• HOW WE MAKE MONEY

SaaS subscription — freemium that converts on the first regression alert.

 **Free****\$0**

1 site · weekly scan · regression email. The hook that proves value.

 **Pro****\$29**/mo

5 sites · auto-runs on every update · AI fixes · trend history.

MOST POPULAR

 **Team / Agency****\$99**/mo

Unlimited sites · auto-blocks bad updates · dashboards · client reports.

 Why it works

Land free, convert the moment a deploy regresses. Agencies are the multiplier — one seat covers dozens of client sites.

 Rough Year-1 target

200 paying teams × ~\$50 avg = ~\$120K a year in recurring revenue.
The agency tier and paid add-ons grow each account over time.

- FIRST 10 CUSTOMERS

Distribute where developers already live — then let agencies multiply us.

1 Give the core away free

A free version plugs into the tools developers already use and runs automatically as they work. They discover us inside their own workflow — no ad spend.

2 Content on a sharp wedge

"Your accessibility is quietly getting worse and you don't know it." Posts + demo videos in startup, web-developer, and accessibility communities.

3 Sell agencies first

Web agencies manage many client sites and carry the legal risk. One conversation = a dozen sites monitored. Highest-leverage first 10.

4 Partner with the obligated

Compliance/legal-tech and WordPress/Webflow shops whose clients must stay accessible — co-sell into their book of business.

— The free version spreads among developers from the ground up; that audience feeds paid sales to agencies at the top. The free tier is the marketing.

• WHO ELSE — AND WHY WE WIN

Everyone audits a moment in time. No one guards the diff for small teams.

PLAYER	WHAT THEY DO	THE GAP WE EXPLOIT
Enterprise Deque, Siteimprove, Level Access	Powerful, full monitoring suites	Enterprise contracts & price — overkill and unaffordable for a 5-person team
Overlays accessiBe, UserWay	Inject a third-party widget	Don't fix the root cause; inject risk and are themselves getting sued
Free tools Lighthouse, WAVE, axe DevTools	Point-in-time manual scans	No memory, no regression tracking, no plain-English fix
Accessibility Monitor	Release-over-release regression alerts	Trustworthy diff + AI fixes, no enterprise contract, no overlay script

— **Unfair advantage:** the only tool giving a small team a trustworthy "what got worse since your last deploy" — affordably, and without a third-party script on their site.

• WHERE WE ARE & WHAT'S NEXT

Working prototype today — accountable pipeline, weeks from live beta.

✅ Built & running

A working scanner that checks a live site · a memory of past scans so we can see what changed · 272 verified accessibility rules · built-in safety checkpoints that pause and ask a human when unsure.

🔧 Still to build

The AI plain-English fixes (early version working) · one-click hosting · the auto-trigger on each update · email alerts · a dashboard for managing multiple sites.

NOW

Prototype

Runs in sample mode

**+4 WKS**

Live MVP

AI fixes + deploy hook

**+8 WKS**

Design-partner beta

3–5 agencies on real sites

**+12 WKS**

Public launch

Free Action + paid tiers

• IT'S REAL — HERE'S IT RUNNING

A working, accountable pipeline — not a slide-ware idea.

- **Working code** — scanner, diff engine, and report builder run today.
- **Verified data** — 272 cleaned rules from 4 sources, each quality-checked before we trust it.
- **Accountable by design** — built-in checkpoints make the system stop and ask a human when it isn't sure.

```
# sample regression report
▼ Accessibility got WORSE since last scan
Health score: 58 → 41 (-17)

NEW (2):
• Button has no accessible name [WCAG 4.1.2]
Fix: add aria-label to <button class="cart">
• Image missing alt text [WCAG 1.1.1]

RESOLVED (1): Low contrast on nav link
Carried over: 3 · Confidence: high ✓
```

- WHAT WE NEED NEXT

Help us turn a working prototype into a live product developers depend on.

Design partners

3–5 web agencies to monitor real client sites and shape the product.

Technical help

Finish the AI explanation layer + deploy infra; harden the regression engine.

Seed support

Runway to reach public launch in ~12 weeks and a paying customer base.

Right now, accessibility burns down in the dark — and no one smells the smoke until someone's harmed. Give us 12 weeks and a handful of partners, and every small team gets the alarm that lets them ship knowing their site got **better, not worse.**
